I. Introduction

This report constitutes the Maryland Public Service Commission's *Ten-Year Plan* (2016-2025) of Electric Companies in Maryland. The Ten-Year Plan is submitted annually by the Commission to the Secretary of the Department of Natural Resources in compliance with § 7-201 of the Public Utilities Article, Annotated Code of Maryland. It is a compilation of information pertaining to the long-range plans of Maryland's electric companies. The report also includes discussion of selected developments that may affect these long-range plans. The analysis contained in the Ten-Year Plan uses forecasts provided by Maryland utilities, PJM Interconnection, LLC ("PJM"), and other state and federal agencies.

The 2016 – 2025 Ten-Year Plan provides a forward-looking analysis of the composition of Maryland's electricity and generation profile, as well as pertinent resources for more detailed information and Commission reports. This Plan will cover the following topics as relevant to Maryland:

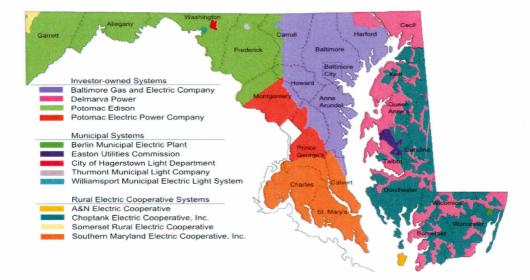

- 1. Maryland Load Growth Forecasts; and
- 2. Transmission, Supply, and Generation.

Changes to Maryland's capacity and generation profile anticipated by this report may necessitate additional infrastructure investment in the State's distribution network to ensure the safe, reliable, and economic supply of electricity. The Commission exercises its statutory and regulatory power to promote adequate, economical, and efficient delivery of utility services in the State through docketed proceedings. An account of these proceedings, including those dealing with distribution infrastructure investments, is published by the Commission in an annual report every March.

II. Background

Maryland is geographically divided into thirteen electric utility service territories. The four largest, by number of Maryland customers, are served by investor-owned utilities ("IOUs"); four represent electric cooperatives (two of which serve mainly rural areas of Maryland); and five are served by electric municipal operations.¹ PJM sub-regions, known as zones, generally correspond with the IOU service territories. PJM zones for three of the four IOUs traverse state boundaries and extend into other jurisdictions.² Figure 1 below provides a geographic picture of the Maryland utilities' service territories. Figure 2 depicts the PJM forecast zones of which Maryland is comprised.

Figure 1: Maryland Utilities and their Service Territories in Maryland^{3,4}

¹ The Commission regulates all Maryland public service companies, as defined by \$1-101(x) of the Public Utilities Article, *Annotated Code of Maryland*.

² Potomac Electric Power Company ("Pepco"), Delmarva Power & Light Company ("DPL"), and The Potomac Edison Company ("PE") are the three IOUs that extend into other jurisdictions. Pepco, DPL, and PE data are a subset of the PJM zonal data, since PJM's zonal forecasts are not limited to Maryland. The Baltimore Gas and Electric ("BGE") zone, alone, resides solely within the State of Maryland.

³ *Cumulative Environmental Impact Report 16*, Maryland Department of Natural Resources, Figure 2-12, http://esm.versar.com/pprp/ceir16/Report_2_2_0.htm (last updated Feb. 20, 2012).

⁴ The Maryland utilities are as follows: Baltimore Gas and Electric Company ("BGE"), Delmarva Power & Light Company ("DPL"), Potomac Edison Company ("PE"), Potomac Electric Power Company ("Pepco"), Berlin Municipal Electric Plant ("Berlin"), Easton Utilities Commission ("Easton"), City of Hagerstown Light Department ("Hagerstown"), Thurmont Municipal Light Company ("Thurmont"), Williamsport Municipal Electric Light System ("Williamsport"), A&N Electric Cooperative ("A&N"), Choptank Electric Cooperative, Inc. ("Choptank"), Somerset Rural Electric Cooperative ("Somerset"), and Southern Maryland Electric Cooperative, Inc. ("SMECO").

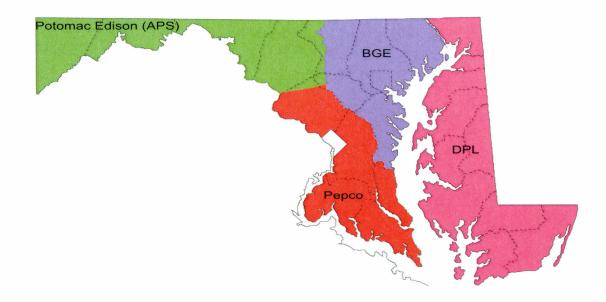

Figure 2: PJM Maryland Forecast Zones⁵

III. Maryland Load Growth Forecasts

Each year, PJM presents a Load Forecast Report for its service territory that is derived in part from an independent economic forecast prepared by Moody's Analytics. The economic analysis includes projections related to the expected annual growth of the gross domestic product ("GDP") and can provide insight into possible trends for regional population growth and household disposable income, which in turn can impact energy sector planning.

The PJM forecast typically contrasts GDP growth projections included in the current (*i.e.* October 2015) load forecast with that of the previous year (*i.e.* October 2014), as depicted below in Figure 3. At the outset of the 2016 - 2025 planning period discussed in this Ten-Year Plan, the projected average GDP growth reflected in the current PJM load forecast is slightly higher than that projected by the previous year's forecast for the same time period, for which PJM cites a near-term increase in household formation as stimulating growth in consumer-based services like education, healthcare, and hospitality.⁶ As a result of this near-term rebound in housing formation, the PJM regional average GDP growth rate has been revised to reflect a projected peak of 3.2% in 2017, as compared to the previous year's forecasted peak of 2.5% expected to occur in

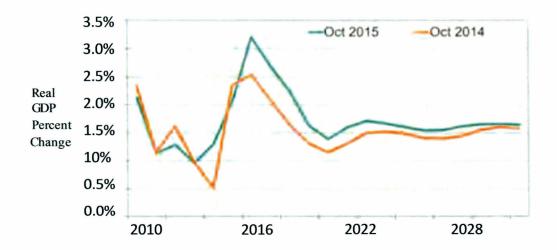

⁵ *PJM Load Forecast Report*, PJM, (Jan. 2016), http://www.pjm.com/~/media/library/reports-notices/load-forecast/2016-load-report.ashx.

⁶ *Id.* at 15-16.

Ten-Year Plan (2016 – 2025) of Electric Companies in Maryland November 2016

2017 as well.⁷ Because the housing formation rate is projected to stabilize over time, however, the PJM region-wide long-term GDP growth projections remain largely comparable to those included in the previous year's forecast, hovering around 1.6% for the duration of the 2016 - 2025 planning horizon covered by this Ten-Year Plan.⁸

Figure 3: Comparison of Real GDP Growth Projections in PJM Metro Areas, October 2014 Load Forecast versus October 2015 Load Forecast⁹

The GDP growth projections discussed above in reference to the larger PJM region translate into varying impacts within the individual states that comprise PJM. As evidenced by Figure 4 below,¹⁰ the southern states in the PJM region, including Maryland, are projected to experience GDP growth rates more on par with the forecasted national average; although, the majority of the PJM region is projected to underperform the U.S.¹¹ Forecasts specific to Maryland are projected to be more stable than other PJM states due to favorable demographic trends and the types of industries expected to dominate the marketplace, such as education, healthcare, and hospitality.¹²

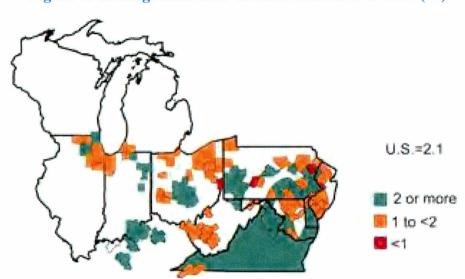

Figure 4: Average Real GDP Growth from 2015 to 2030 (%)

Consistent with the stability projected for the State by the PJM 2016 Load Forecast Report, load forecasts submitted by the Maryland utilities for the 2016 – 2025 planning period discussed in this Ten-Year Plan are comparable to the forecasts provided to the Commission over the last several years. The Maryland utilities' load forecasts indicate a modest amount of projected annual growth in the number of customers, energy sales, and peak demand throughout the State. The current forecasts, however, do anticipate slightly lower energy sales and summer and winter peak demand forecasts compared to the forecasts from previous Ten-Year Plans. Although a departure from prior forecasts, this trend is in line with the increased efficiency measures deployed throughout Maryland and the subsequent reduced demand, as discussed further in Section III.D. of this Plan.

| Compound Annual Growth Rate Projections 2013, 2014, 2015, and 2016 | | | | | | | | | |
|--|----------------------------|----------------------------|----------------------------|----------------------------|--|--|--|--|--|

| Customer Forecasts | 0.6% | 0.7% | 0.5% | 0.7% | | | | | |
| Energy Sales | 0.9% | 1.3% | 1.2% | 0.8% | | | | | |
| Summer Peak Demand Forecasts | 1.1% | 0.9% | 0.9% | 0.5% | | | | | |
| Winter Peak Demand Forecasts | 1.0% | 0.8% | 0.8% | 0.6% | | | | | |

Table 1: Comparison of Compound Annual Growth Rate Projections –2013, 2014, 2015, and 2016¹³

¹³ See Appendix Tables 1(a)(i), 2(a)(i), 3(a)(i), 3(a)(iii).

A. Customer Growth Forecasts¹⁴

At the close of 2015, approximately 90% of utility customers in Maryland were categorized as residential ratepayers; however, residential sales represented only 44% of the year's total retail energy sales, as illustrated in Figure 5 below.¹⁵ Conversely, commercial and industrial ("C&I") customers represented just over 10% of Maryland utility customers, but corresponded to over half of the total retail energy sales for the State. Therefore, while growth and usage trends in the residential sector should be closely monitored, the overall projected stability of residential sector growth renders a change in either the commercial or industrial sector as potentially more impactful to statewide energy sales projections.

Utility customer growth, particularly in the residential sector, is closely linked to household formation projections. The current PJM load forecast incorporates projections of a near-term rebound in housing formation rates, followed by a period of relative stability.¹⁶ Over the planning horizon, however, the projected housing formation rates differ widely across the PJM service territory, as evidenced by Figure 6 below.

¹⁴ See Appendix Table 1(a) for a complete list of utility-by-utility customer growth forecasts. ¹⁵ See Appendix Tables 1(b)(i) and 1(b)(ii).

¹⁶ *PJM Load Forecast Report,* PJM, (Jan. 2016) at 16, http://www.pjm.com/~/media/library/reports-notices/load-forecast/2016-load-report.ashx.

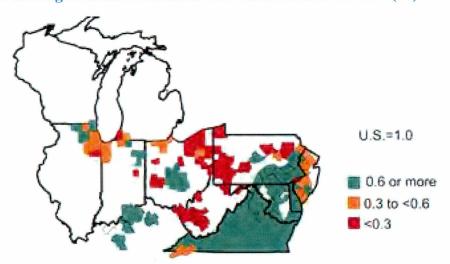

Figure 6: Average Annual Household Growth from 2015 to 2030 (%)

As illustrated by Figure 6 above, Maryland – along with other southern PJM states – retain an advantage compared to the rest of the service territory with respect to forecasted household formation rates, and thus utility customer growth projections. The PJM load forecast attributes this to expected growth in consumer-based services in the applicable states, including Maryland.¹⁷ Further, the PJM forecast regarding expected rates of household formation in Maryland is bolstered by the State's strong population growth in recent years, which translates to a greater number of households in the long run.

The population in Maryland continued to grow in 2015 – albeit at a slower rate than in prior years – which contributed to a net increase in electricity customers. While this was the smallest percentage increase in population realized by Maryland since the 2006 - 2007 timeframe, the State has been growing at a faster rate than most of the nation. Among the 50 states and the District of Columbia, Maryland experienced the fourteenth largest numeric gain in population in 2015; the ninth largest numeric gain over the last five years; and more growth than all of the Northeastern States, with the exception of Delaware and the District of Columbia.¹⁸ This trend is expected to continue as more international migrants come to the State.¹⁹

This trend regarding population growth, near-term increases in housing formation and long-term stability, is mirrored by the Maryland utilities' forecasts regarding customer growth; for the majority of this ten-year planning period, their forecasts depict modest annual growth rates. As reflected in Table 2 below, the statewide forecasted compound annual growth rate during the planning period is 0.7% for all customer classes,

¹⁸ Population Growth for Maryland in 2015, Maryland Department of Planning,

¹⁷ Id.

http://www.mdp.state.md.us/msdc/Pop_estimate/Estimate_15/Population%20Growth%20Slows%20for%2

¹⁹ Id. at 2.

which translates into a 6.8% increase in the total number of Maryland customers by the end of the ten-year planning period. During this timeframe, Berlin, PE, Pepco, and SMECO are projecting their overall customer bases to increase by 7.6% or more.

| Year | Berlin | BGE | Chop- tank | DPL | Easton | Hagers -town | PE | Pepco | SMECO | Thur- mont | William- sport | Total |

 Table 2: Maryland Customer Forecast (All Customer Classes)²⁰

The customer forecasts provided by the utilities are comparable to the forecasts they provided for the 2015 – 2024 Ten-Year Plan. Overall, the increase in the number of customers across Maryland is primarily driven by growth in the residential class. Growth in the residential sector is projected to account for an additional 160,096 customers by 2025, or 92% of total new customers projected. The largest absolute increase in the number of customers is projected to come from BGE's residential customer base, with the addition of 68,846 residential customers forecasted during this planning period.²¹ BGE's projected increase in its residential customer base accounts for 43% of the total number of new residential customers across all service territories during the ten-year planning period.²² The increase in residential customers for BGE translates into a compound annual growth rate of $0.7\%^{23}$ which is comparable to the "0.6% or more" average household formation rate projected by PJM for this zone.

Although several Maryland utilities are projecting a sizeable increase in their customer bases during this planning period, Table 3 below shows that the aggregated utilities' customer forecasts are only 1.9% higher than the projections provided during the previous planning period. The most significant change observable in the aggregated

²⁰ See Appendix Table 1(a)(i). Note that A&N and Somerset did not provide the requested applicable information in response to the Commission's 2016 data request for the Ten-Year Plan.

 ²¹ See Appendix Table 1(a)(ii).
 ²² Id.

 $^{^{23}}$ Id.

statewide data between the previous and current Ten-Year Plan forecasts is within the "Other" customer class,²⁴ largely attributable to projections provided by PE. In the previous planning period, the Company updated its model to reflect the decline in this category of customers, which it has been experiencing in its territory since 2009. The percentage decrease of the "Other" customer class anticipated in the 2016-2025 Ten-Year Plan, however, is less than that projected by the 2015-2024 Plan.

| Class | 2015 to 2024 | 2016 to 2025 | Difference |
|------------------------|--------------|--------------|------------|
| Residential | 5.0% | 7.0% | 1.9% |
| Commercial | 3.3% | 4.7% | 1.4% |
| Industrial | 12.5% | 13.8% | 1.4% |
| Other | -3.3% | -0.8% | 2.5% |
| Resale | 0.0% | 0.0% | 0.0% |
| Total Customers | 4.9% | 6.8% | 1.9% |

Table 3: Projected Percentage Increase in the Number of
Customers by Class, 2016 – 2025 25

Aside from noteworthy observations visible in the aggregated utility forecasts, there are other trends of note in the customer forecasts provided by individual utilities for the 2016 – 2025 planning period. For example, SMECO forecasted the largest percentage differences of all utilities with respect to the residential and commercial classes, with an increase of 10.1% and 13.7%, respectively.²⁶ The Cooperative's projected increases in both the residential and commercial customer classes can be attributed to its reliance on the Maryland Office of Planning forecasts, which project an average annual growth rate of 1.6% for the region. Additionally, BGE is projecting the largest percentage difference (17.5%) of all utilities with respect to the industrial customer class, which the Company attributes to the general improvement of the economy.²⁷

²⁴ The "Other" rate class refers to customers that do not fall into one of the listed classes; street lighting is an example of a rate class included under "Other." The Resale class refers to Sales for Resale which is energy supplied to other electric utilities, cooperatives, municipalities, and Federal and State electric agencies for resale to end use consumers. PE is the only utility with any resale customers; these wholesale customers are PJM, Monongahela Power Company, West Penn Power Company, and Old Dominion Electric Cooperative.

²⁵ See Appendix Table 1(a)(i)-(vi) for more information.

²⁶ See Appendix Table 1(a)(ii) and 1(a)(iii) for more information.

²⁷ See Appendix Table 1(a)(iv) for more information.

B. Energy Sales Forecast

The Maryland utilities provide forecasts for energy sales and peak load in terms of "Gross of Demand Side Management ("DSM")" and "Net of DSM."²⁸ In order to provide a more complete look at Maryland energy sales and peak demand forecasts, Sections III.B and III.C discuss the forecasts in "Gross of DSM" terms, which reflect the forecasts *before* the impact of DSM programs. Table 4 shows the energy sales forecast within Maryland (Gross of DSM) for the ten-year planning period, as provided by the utilities. The aggregated forecasts show a compound annual growth rate of 0.8% across all the Maryland service territories for 2016 – 2025, a decrease from the 1.2% annual growth rate reported in the 2015 – 2024 Ten-Year Plan.

| | Berlin | BGE | Choptank | DPL | Easton | Hagers- town | PE | Pepco | SMECO | Total |
|--------------------------------------|--------|-------|----------|-------|--------|-----------------|------|-------|-------|-------|
| Change (2016- 2025) | 4 | 3,299 | 277 | (363) | 12 | 18 | 570 | 456 | 377 | 4,600 |
| Percent Change (2016- 2025) | 10.2% | 10.5% | 20.3% | -8.0% | 4.5% | 5.8% | 7.1% | 3.0% | 10.2% | 7.1% |
| Compound Annual Growth Rate | 1.1% | 1.1% | 2.1% | -0.9% | 0.5% | 0.6% | 0.7% | 0.3% | 1.1% | 0.8% |

 Table 4: Maryland Energy Sales Forecast (GWh) (Gross of DSM)

The statewide energy sales growth rate derived from the utilities' 2016 - 2025 forecasts is 0.4% lower than the rate projected in last year's report, primarily due to BGE's revised projections of a lower energy sales growth rate than included in the 2015 – 2024 Ten-Year Plan.³⁰ Despite this downward revision, the overall growth projected by BGE for this ten-year planning period remains the largest of any Maryland utility in absolute terms, with the Company projecting an additional 3,299 GWh in energy sales by 2025. In fact, absent BGE's inclusion in the statewide projections, the statewide compound annual growth rate for this planning period drops from 0.8% to 0.3%.

While BGE is forecasting the largest absolute increase in total energy sales during this planning horizon, Choptank is anticipating the largest percentage change. The link between economic and energy sales projections is highlighted by the reasoning offered in support of BGE's and Choptank's forecasts. BGE's forecast takes into consideration the stability of the economic outlook, coupled with the large forecasted growth in industrial

²⁸ See Appendix Table 2(a)(ii) for the Maryland Energy Sales forecast, Net of DSM programs; Appendix Table 3(a)(ii) for the Maryland Summer Peak Demand Forecast, Net of DSM programs; and Appendix Table 3(a)(iv) for the Maryland Winter Peak Demand Forecast, Net of DSM programs.

²⁹ See Appendix Table 2(a) for utility-by-utility energy sales forecasts for the Maryland service territory, available by Gross and Net of DSM. See Appendix Table 2(b) for the same information on a system wide basis.

³⁰ Only two of the utilities projected larger growth rates for the 2016 - 2025 planning horizon than for the previous year's Plan (Berlin and Pepco).

customers as discussed earlier, as reasons for continued and steady energy sales growth over the next ten years. Choptank's forecast takes into consideration steady growth in the residential and small commercial customer classes as the economy and incomes remain stable throughout its territory.

C. Peak Load Forecasts

PJM's 2016 Load Forecast Report includes long-term projections of peak loads for the entire wholesale market region and each PJM zone.^{31,32} Due to the fact that the PJM zones can extend outside of Maryland, the utilities submit peak demand forecasts restricted to their Maryland service territories as part of the Ten-Year Plan.³³ According to PJM's 2016 Load Forecast Report, the PJM Regional Transmission Organization ("RTO") will continue to be summer peaking during the next 15 years.³⁴ In 2016, the four PJM zones of which Maryland is comprised are projected to experience their peak demands during the month of July,³⁵ the same month as the broader PJM Mid-Atlantic Region.³⁶

In contrast to PJM's forecasts, Berlin, DPL, Hagerstown, and PE are forecasting their peak demands to occur in the winter in most or all of the forecasted years. With the exception of DPL, these utilities have peaked in the winter consistently over the past few planning periods for reasons such as: higher concentrations of electric heating; geographical features; and colder temperatures.

Figure 7 compares the average of the Maryland utilities' forecasted summer peak demands for their Maryland service territories with summer forecasts for the PJM Mid-Atlantic Region and for the PJM RTO as a whole. As illustrated below, the utilities' average summer peak demand growth rate follows a similar path to the PJM RTO and the PJM Mid-Atlantic Region. In the near-term, the PJM RTO is showing stronger peak demand growth rate than the Maryland utilities and the PJM Mid-Atlantic Region due to the Dominion Virginia Power zone, which is projected to add 1,579 MW of summer peak load and to grow at an average of 2.7% over the next three years.³⁷

³⁷ *Id.* at 52

³¹ PJM Load Forecast Report, PJM, (Jan. 2016) at 52, Table B-1,

http://www.pjm.com/~/media/library/reports-notices/load-forecast/2016-load-report.ashx.

³² The four PJM zones spanning the Maryland service territory include APS, BGE, DPL, and PEPCO. *See supra* Figure 2 for a map of the Maryland zones. "APS" represents the Allegheny Power Zone, of which PE is a sub-zone.

³³ See Appendix Table 3(a) for more information on in-State peak demand forecasts for Maryland utilities, available for summer and winter, and by gross and net of DSM programs. See Appendix Table 3(b) for the same information, presented as system wide data for utilities operating in Maryland.

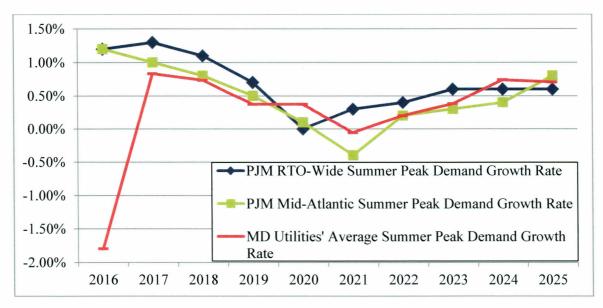

³⁴ *PJM Load Forecast Report*, PJM, (Jan. 2016) at 2, http://www.pjm.com/~/media/library/reportsnotices/load-forecast/2016-load-report.ashx.

³⁵ *Id.* at 62-63, Table B-5.

³⁶ *Id.* Three of the Maryland PJM zones (BGE, DPL, and Pepco) are considered to be part of the PJM Mid-Atlantic Region. The fourth Maryland PJM zone (APS) is presented as part of the PJM Western Region data set.

Also reflected in Figure 7 is a brief spike in the summer peak demand growth rates for the PJM RTO and the Maryland utilities in 2017, after which time the growth rates generally level off through 2025. The PJM 2016 Load Forecast report notes that 2021 corresponds to the next Regional Transmission Expansion Plan ("RTEP") study year, which may account for the fact that the 2016 forecast shows a projected 5.1% decrease in the PJM RTO summer peak demand forecast in 2021 as compared to the 2015 forecast.³⁸ This projected decrease had different implications in various zones throughout the PJM RTO, however, and it translated into a smaller decline of only 0.4% projected summer peak demand growth rate for 2021 in the PJM Mid-Atlantic Region.³⁹

Figure 7: Average of Utilities' Projected Summer Peak Demand Growth Rates (Gross of DSM) Compared to Projected Summer Peak Demand Growth Rates for PJM Mid-Atlantic and PJM RTO⁴⁰

The Maryland utilities also provided peak demand forecasts for the winter season in response to the Ten-Year Plan data request. Figure 8 below depicts an average of the Maryland utilities' forecasted winter peak demands, contrasted with winter peak demand forecasts for the PJM Mid-Atlantic Region and for the PJM RTO. A visual comparison of Figure 7 and Figure 8 illustrates that the aggregated Maryland utilities' winter peak demand forecast follows a trajectory comparable to the summer peak demand growth rate projections. Both the PJM summer and winter peak demand forecasts and the PJM GDP growth forecast follow a pattern of peaking in the near-term before transitioning to a more modest level of projected growth in the second half of the planning period. The Maryland utilities' summer and winter peak demand forecasts also follow this pattern.

³⁸ Id. at 2.

 ³⁹ *Id.* at Table B-1.
 ⁴⁰ The Utilities' average summer peak demand growth rates were calculated using the Utilities' data responses to the Commission's 2016 data request for the Ten-Year Plan. See Appendix Table 3(a)(i).

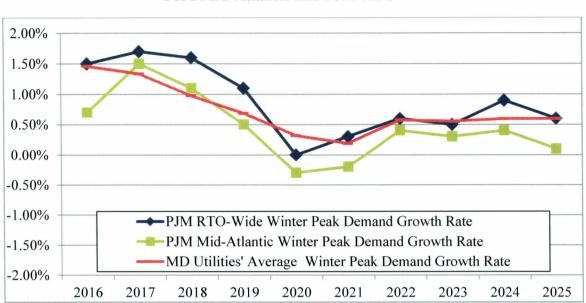

Figure 8: Average of Utilities' Projected Winter Peak Demand Growth Rates (Gross of DSM) Compared to Projected Winter Peak Demand Growth Rates for PJM Mid-Atlantic and PJM RTO^{41,42}

As shown in Table 5 and Table 6 below, the ten-year forecasted Maryland growth rates of summer and winter peak demand (gross of DSM) are 0.5% and 0.7%, respectively.⁴³ In 2025 at the end of this planning timeframe, these growth rates translate into an expected summer peak demand load (gross of DSM) for the Maryland service territory of 14,903 MW and an expected winter peak demand load (gross of DSM) for Maryland of 13,380 MW.⁴⁴

Table 6: Maryland Winter Peak Demand Forecast (MW) (Gross of DSM)^{47, 48}

Figure 9 and Figure 10 compare the current and historical peak demand growth rates for the four PJM zones of which Maryland is comprised. As illustrated below, all four zones are projecting lower levels of growth than forecasted during the previous planning period. This trend corresponds to the utilities' peak demand forecasts, summarized in Table 5 and Table 6 above, which reflect diminished projections for the BGE, DPL, PE, and Pepco service territories relative to the previous planning period. Figure 11 illustrates that both the summer and winter peak demand growth rates of the PJM RTO and the PJM Mid-Atlantic region have also declined from the previous planning period. This is largely attributable to the changes that PJM made in the load forecast models since the 2015 report; these changes are intended to better reflect weather, heating and cooling equipment saturation and efficiency, and the distributed solar generation deployed throughout PJM.⁴⁹

⁴⁷ See Appendix Tables 3(a)(i) and 3(a)(iii).

 ⁴⁸ Thurmont and Williamsport were not included in this table because the companies do not have any changes in their peak demand forecasts over the ten year period.

D. Impact of Demand Side Management

DSM programs result in lower growth of both energy sales and peak demand. To evaluate the impact of DSM programs, this section reflects the Maryland utilities' energy sales forecasts *after* the benefits of DSM programs are included ("net of DSM"). For purposes of this section, only the five utilities participating in EmPOWER Maryland are evaluated: BGE, DPL, PE, Pepco, and SMECO ("the Participating Utilities").⁵³ According to the Participating Utilities' Ten-Year Plan forecasts, the DSM programs will save a total of 33,279 GWh over the planning period. These savings will be achieved by reducing the annual rate of growth in energy sales and peak demand.

Figure 12 below shows the impact of the Participating Utilities' DSM programs on their respective energy sales projections over the duration of the ten-year planning period. BGE is forecasting the largest quantity of energy savings stemming from DSM programs, most notably from its Residential Lighting and Appliances Programs, and Smart Grid Programs, which represent 20.6% and 26% of BGE's forecasted savings,

http://www.pjm.com/~/media/library/reports-notices/load-forecast/2016-load-report.ashx.

⁵³ See The EmPOWER Maryland Report to the General Assembly for more information on the energy efficiency and demand response programs associated with EmPOWER Maryland, *available at:* http://www.psc.state.md.us/wp-content/uploads/2016-EmPOWER-Maryland-Energy-Efficiency-Act-Standard-Report.pdf.

⁵² *PJM Load Forecast Report*, PJM, (Jan. 2015) at Table B-1 and Table B-2,

http://www.pjm.com/~/media/library/reports-notices/load-forecast/2015-load-forecast-report.ashx; *PJM Load Forecast Report*, PJM, (Jan. 2016) at Table B-1 and Table B-2,

respectively.⁵⁴ Conversely, SMECO is forecasting the lowest quantity of savings attributable to DSM programs, due primarily to the fact that the Cooperative does not implement as many programs outside of its traditional energy efficiency and conservation ("EE&C") portfolio as compared to the other utilities. While SMECO operates a conservation voltage reduction ("CVR") program in addition to its EE&C portfolio, other Participating Utilities offer additional programs, such as: Dynamic Pricing, Streetlights, and High Efficiency Transformers.

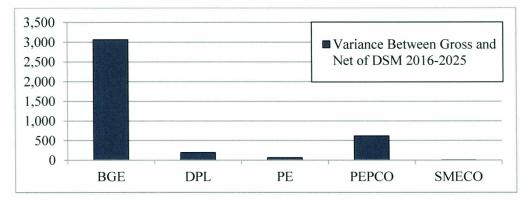

Figure 12: Impact of the Participating Utilities' DSM Programs on the Ten-Year Energy Sales Projections (MWh)⁵⁵

Figure 13 details the impact of the DSM programs on the Participating Utilities' 2016 peak demand forecasts as compared to their respective 2025 projections. As noted above, all of the Participating Utilities' programs are expected to experience an increased differential in peak demand growth attributable to DSM programs; however, Pepco is projecting the largest demand savings to accrue during the planning period attributable to the DSM programs. Pepco is forecasting that summer peak demand will be lower in 2025 than in 2016 due to its DSM programs, despite forecasted growth of 9% in the number of customers during the planning period and a summer peak demand growth rate (gross of DSM) for the 2016 – 2025 planning period of 2.9%.

⁵⁴ BGE's response to Staff's Data Request. The percentages represent the total savings the programs comprise of the 2015-2017 program cycle plan.

⁵⁵ See Appendix Table 2(a)(i) and 2(a)(ii) for the data used to make this Figure.

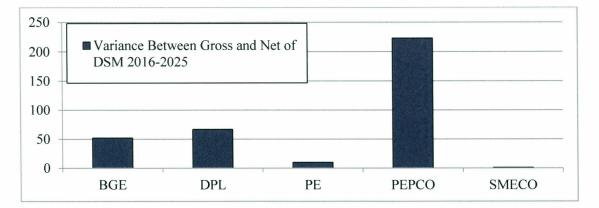

Figure 13: Impact of the Participating Utilities' DSM Programs on the Ten-Year Summer Peak Load (MW)⁵⁶

The tables below compare the growth in DSM savings across the Participating Utilities from 2016 to 2018. The forecasted savings post-2017, however, fluctuate in derivation method and amount across the Participating Utilities given that Commission-approved plans for utility-implemented EE&C programs pertain to the 2015 – 2017 program cycle only at this time.⁵⁷ Table 7 shows the growth in demand savings from DSM programs due to EE&C portfolios, while Table 8 shows the growth in total demand savings attributable to DSM programs as a whole. The variation in the magnitude of impact of the EE&C and DSM programs by utility are due to the different sizes of the programs offered and the way in which the data was forecasted by the Participating Utilities. Also, the Commission notes that demand savings projections later in the 2016 – 2025 planning horizon may be affected by future iterations of EmPOWER Maryland program cycle proposals, as well as pending changes to the capacity market as a result of PJM's Capacity Performance Proposal.⁵⁸

⁵⁶ See Appendix Table 3(a)(i) and 3(a)(ii) for the data used to make this Figure.

⁵⁷ Because the Commission has only approved plans pertaining to the 2015 – 2017 program cycle at this date, BGE did not include any EE&C savings projections after 2017, with the exception of its Residential Demand Response Program. The other Participating Utilities assume a constant level of savings post-2017. ⁵⁸ On June 15, 2015, the FERC approved a proposal by PJM to dramatically restructure its capacity market, referred to as the "capacity performance" ("CP") proposal. PJM noted that its proposal is intended to result in larger capacity payments for the most reliable resources, and higher penalties for non-performers. Critics of the CP proposal, including the Maryland Commission, countered that the changes are unnecessary for reliable service operations and will likely increase electricity end user costs significantly, and further that the CP proposal generates major concerns regarding the future of DR and intermittent resources. Without modification to the CP proposal, the Maryland Commission and others warned that the majority of DR resources will be required to withdraw from the PJM market. On November 17, 2016, PJM filed with the FERC several improvements to the CP proposal, which it asserts will increase opportunities for seasonal resources (such as summer-focused DR programs) to participate in the capacity auctions. With FERC approval, the changes would be in effect for the May 2017 auction for the 2020 – 2021 delivery year. Because of the uncertainty surrounding the PJM CP proposal and proposed modifications, this Ten-Year Plan does not speculate further as to the CP proposal's impact on Maryland utilities' future DSM savings during the remainder of the ten-year planning horizon; however, future iterations of the Ten-Year Plan will explore this topic further.

Table 7: Average Annual Increase in Demand Savings due to DSM Programs from2016 to 2018 for EE&C Programs

| Description | BGE | DPL | PE | Pepco | SMECO |
|---|-------|-------|------|-------|--------------|
| Average Annual MW Savings Increase due to DSM Programs | -4.2% | 16.4% | 4.5% | 13.6% | 0.4% |

Table 8: Average Annual Increase in Demand Savings due to DSM Programs from2016 to 2018 for All DSM Programs

| Description | BGE | DPL | PE | Pepco | SMECO |
|---|------|-------|------|-------|-------|
| Average Annual MW Savings Increase due to DSM Programs | 0.1% | 11.7% | 3.8% | 10.3% | 0.3% |

As illustrated by Figure 14, none of the Participating Utilities are forecasting a significant reduction in *winter* peak demand due to the DSM programs, since the majority of DSM programs focus on summer peak demand reduction opportunities. While Pepco and DPL operate energy efficiency programs similar to the other Participating Utilities, the PHI Companies did not project any DSM program savings for the winter peak load. Conversely, BGE projected sizeable winter peak demand savings, attributable to a combination of its residential direct load control (*i.e.*, hot water heaters), CVR, Dynamic Pricing, and Smart Grid program offerings. PE and SMECO reported savings from several EE&C programs as well; although due to a reporting nuance, the graph below appears to reflect a zero net impact for the SMECO service territory.⁶¹

⁵⁹ Responses to the Commission's Ten-Year Plan Data Requests.

⁶⁰ Id.

⁶¹ SMECO reports a difference in the total numbers for gross and net winter peak demand; however, there is no difference in the growth rates.

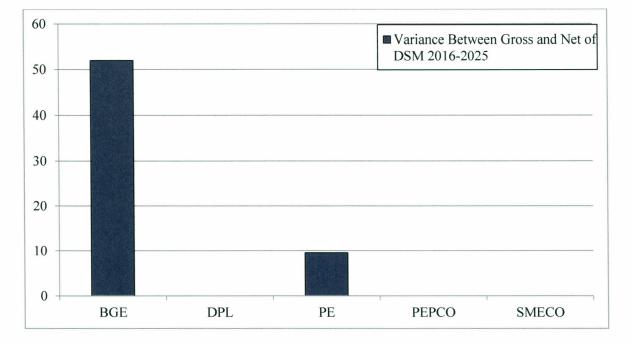

Figure 14: Impact of the Participating Utilities' DSM Programs on the Ten-Year Winter Peak Load (MW)⁶²

⁶² See Appendix Tables 3(a)(iii) and 3(a)(iv) for data used to derive this graph.

IV. <u>Transmission, Supply, and Generation</u>

In order to ensure a safe, reliable, and economic supply of electricity in Maryland, an appropriate balance of generation, DSM, imports, and transmission must be achieved. While importation and DSM offer ancillary benefits to managing the power supply, it is critical that local generation is established and maintained to mitigate the risk to Maryland's long-term reliability.

For purposes of the Ten-Year Plan, the congestion costs and the role of transmission infrastructure in planning processes are discussed in Section IV.A; Section IV.B focuses on the State-specific impact of Maryland's status as a net importer of electricity. Information related to the Commission's concerns about the capacity, composition, and advanced age of Maryland's current generation profile is discussed in Section IV.C.

Maryland depends on regional transmission and importation by the PJM market system. All load serving entities in PJM are required to ensure that they have sufficient capacity contracts to provide reliable electric service during periods of peak demand. As of 2014, Maryland's net summer generating capacity was approximately 12,264 MW.⁶³ Maryland's peak demand forecast for 2016, net of utility demand-side management and energy conservation measures, is approximately 12,392 MW.⁶⁴ Although Maryland's summer peak demand has grown faster than the State's net summer generating capacity over the last several years, Maryland was able to meet 98.3% of its summer peak demand energy imports discussed in more detail in Part B of this section.

A. Regional Transmission ⁶⁶

PJM in its 2015 Regional Transmission Expansion Plan ("RTEP") authorized various electric transmission improvement projects. The development of the RTEP takes into account the total effects of system trends, which are often driven by federal and state policy decisions. The planning process takes into consideration: generator deactivations for environmental compliance; changes in generator fuel sources; and changes in reliability criteria, such as diminished load, winter weather, and transmission infrastructure.⁶⁷

⁶³ The U.S. Energy Information Administration ("EIA"), State Electricity Profile: Maryland; <u>http://www.eia.gov/electricity/state/Maryland/</u>.

⁶⁴ See Appendix Table 3(a)(ii).

⁶⁵ The EIA's most recent data available is from 2014. The next anticipated release date is listed as February 2017.

⁶⁶ See Appendix Table 4 for a full list of transmission enhancements proposed by Maryland utilities. ⁶⁷ 2015 Regional Transmission Expansion Plan. PJM, (Aug. 7, 2015) at 5 - 7,

http://pjm.com/~/media/documents/reports/2015-rtep/2015-rtep-book-1.ashx.

1. **Regional Transmission Congestion**

Congestion reflects the underlying characteristics of the power system, including the nature and capability of transmission facilities as well as the cost and geographical distribution of facilities. Congestion occurs when available, least-cost energy cannot be delivered to all load because of inadequate transmission facilities, thereby causing the price of energy in the constrained area to be higher than in an unconstrained area.⁶⁸ PJM's Locational Marginal Pricing ("LMP") system is designed to reflect the value of energy at a specific location and time of delivery, thus measuring the impact of congestion throughout the PJM system.

As shown in Table 9, in 2015 the congestion costs decreased for the first time in three years. Total congestion costs for the PJM RTO decreased by 28.3% (\$546.9 million) between 2014 and 2015; whereas, the total PJM congestion costs increased by 185.4% (\$1,255.3 million) between calendar years 2013 and 2014.⁶⁹ The APS control zone continues to experience congestion causing higher prices in the BGE, Pepco, and DPL control zones. According to PJM, AP was the sixth most congested PJM zone in 2015.⁷⁰ This is a decline from 2014, in which the APS zone was the fourth most congested PJM zone. This decline corresponds to the lower congestion costs experienced by the rest of the Maryland zones in 2015.

| Change in Costs for MD Zones From Previous Year | -62.5% | 88.3% | 179.4% | -33.1% |

Table 9: PJM Total Annual Zonal Congestion Costs, 2012 – 2015⁷¹

2. Regional Transmission Upgrades

The Commission recognizes the need to maintain and improve the transmission system within Maryland in order to ensure safe, reliable, and economic electricity service to the State's ratepayers. As with increases in local generating capacity and the reduction

⁷¹ Id.

⁷² In 2016, the North American Electric Reliability Corporation ("NERC") determined that SMECO's 230 kV facilities should be considered as part of the bulk electric system, resulting in a requirement that SMECO register with NERC as a transmission owner with respect to the applicable facilities. On November 1, 2016, PJM and SMECO submitted a joint filing with the Federal Energy Regulatory Commission ("FERC") in Docket No. ER17-282 proposing to make SMECO subject to PJM transmission operations and planning protocols. Subject to FERC approval of the SMECO/PJM filing, SMECO will be added to the Transmission Owners Agreement as a Zero Revenue Requirement Party. Zonal congestion costs for SMECO will continue to be reflected in the Pepco Transmission Control Zone. *See* PJM Interconnection, LLC, *Docket No. ER17-282-000 (OATT) and Docket No. ER17-283-000(TOA)* (Nov. 1, 2016), http://www.pjm.com/media/documents/etariff/FercDockets/2003/20161101-er17-282-000.pdf.

of system load, transmission expansions and improvements can reduce congestion and LMP differences among zones; such improvements may also support reliability requirements and mitigate economic concerns.

Appendix Table 4 lists all transmission enhancements identified by the Maryland utilities in response to data requests for the Ten-Year Plan. Together, the 64 identified transmission enhancements in Appendix Table 4 account for over 266 miles of upgrades.

B. Electricity Imports

Maryland continues to be a net importer of electricity, similar to many other states in PJM.⁷³ As of 2014, 44% of the electricity consumed in the State is imported from other states.⁷⁴ As illustrated in the table below, nine of the 13 PJM states plus the District of Columbia are net importers of electricity. In a nationwide comparison, Maryland is the third largest electricity importer based on percentage of electricity sales.⁷⁵ Only the District of Columbia and Massachusetts exceed Maryland in the percentage of electricity sales that are imported. In contrast, as of 2014, the states within the PJM region that exported more electricity in aggregate than consumed within each state are: Illinois, Kentucky, Pennsylvania, and West Virginia.⁷⁶ Table 10 shows the percentage of retail sales that was imported by Maryland in 2014, along with other netimporting states in the PJM RTO and the country.

⁷³ PJM operates, but does not own, the transmission systems in: (1) Maryland; (2) all or part of 12 other states; and (3) the District of Columbia. With FERC approval, PJM undertakes the task of coordinating the movement of wholesale electricity and provides access to the transmission grid for utility and non-utility users alike. Within the PJM region, power plants are dispatched to meet load requirements without regard to operating company boundaries. Generally, adjacent utility service territories import or export wholesale electricity as needed to reduce the total amount of capacity required by balancing retail load and generation capacity.

Table 10: State Electricity Imports (Year 2014) (GWh)

Maryland continues to be a net importer as in-State generation has declined in recent years. In 2007, Maryland resources generated over 50 million MWh in electricity. By 2014, however, in-State resources generated slightly under 38 million MWh.⁷⁸

The EmPOWER Maryland program, along with other energy efficiency efforts across the State, contributes to a decrease in the peak demand, which reduces the need to increase capacity and generation capabilities both in Maryland and throughout the PJM region. On a per capita basis, Maryland's actual peak demand for 2014 was 2.07 kW.⁷⁹ Compared to the per capita peak demand in 2007 of 2.56 kW, there has been a 19% decrease over the last 7 years.

C. Maryland Capacity and Generation Profiles

The capacity and generation profiles of in-State resources must be comprehensively analyzed for both short- and long-term reliability planning purposes, due to the uncertain future of coal-fired generation.⁸⁰ In Case No. 9214, the Commission observed that the State's reliability risk is further heightened because neighboring states that export electricity into Maryland also have at-risk coal-fired generation.⁸¹

1. Conventional Capacity and Generation Profiles, 2014

Coal-fired power plants represent 39% of the electric generating capacity in Maryland, of which almost 90% of such capacity is aged 31 years or older. Within this category, 52.4% is considered "at-risk," as defined by PJM.⁸² Table 11 and Table 12 below depict the electric generating capacity in Maryland, as well as the age of plants by fuel type.⁸³

| | Capacity | | | | |
|--------------------------|-------------|-------------------------|--|--|--|
| Primary Fuel Type | Summer (MW) | Percent Of Total | | | |
| Coal | 4,739.0 | 39.0% | | | |
| Oil and Gas | 4,779.4 | 39.3% | | | |
| Nuclear | 1,707.8 | 14.0% | | | |
| Hydroelectric | 590.0 | 4.9% | | | |
| Other and Renewables | 342.6 | 2.8% | | | |
| Total | 12,158.8 | 100.0% | | | |

Table 11: Maryland Summer Peak Capacity Profile, 2014⁸⁴

⁸² PJM categorizes coal generation more than 40 years old and less than 400 MW as at "high-risk" of

⁸⁰ The uncertainty stems from the economic pressure on coal as a result of decreasing natural gas prices, as well as from regulations promulgated by the U.S. Environmental Protection Agency.

⁸¹ Case No. 9214, In the Matter of Whether New Generating Facilities Are Needed to Meet Long-Term Demand for Standard Offer Service. Order No. 84815 (April 12, 2012) at 19.

retirement. Case No. 9214, In the Matter of Whether New Generating Facilities Are Needed to Meet Long-Term Demand for Standard Offer Service, PJM Comments (January 13, 2012) at 11-12.

⁸³ See Appendix Table 5 for a complete list of Maryland generation capacity in 2014.

⁸⁴ *Report EIA-860: "3_1_Generator_Y2014" Excel*, U.S. Energy Information Administration (last visited June 6, 2016), http://www.eia.gov/cneaf/electricity/page/eia860.html.

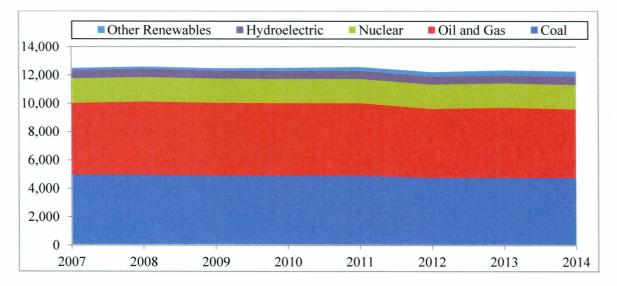

Ten-Year Plan (2016 – 2025) of Electric Companies in Maryland November 2016

| Drimory Fuel Type | Age of Plants, By Percent | | | | | |
|----------------------|---------------------------|-------------|-------------|-----------|--|--|
| Primary Fuel Type | 1-10 Years | 11-20 Years | 21-30 Years | 31+ Years | | |
| Coal | 0.0% | 5.6% | 5.6% | 88.9% | | |
| Oil and Gas | 9.5% | 20.0% | 17.1% | 53.3% | | |
| Nuclear | 0.0% | 0.0% | 0.0% | 100.0% | | |
| Hydroelectric | 0.0% | 0.0% | 0.0% | 100.0% | | |
| Other and Renewables | 78.7% | 8.2% | 11.5% | 1.6% | | |

Table 12: Age of Maryland Generation by Fuel Type, 2014⁸⁵

Maryland's summer peak capacity profile decreased by 75 MW in 2014 compared to 2013, as illustrated in Figure 15. While this represents an overall decline statewide compared to the immediately preceding year, this is still an improvement over 2012. The new capacity added in 2014 can be attributed to increases in renewable generation from solar and wind.

Figure 15: Maryland Summer Capacity Profile (MW), 2007 – 2014⁸⁶

Maryland's generating profile differs from its capacity profile. Coal and nuclear facilities typically generate an overwhelming majority of all electricity produced in Maryland, even though these resources represent a little over half of in-State capacity.⁸⁷

⁸⁵ Id.

⁸⁶ Electricity Power Industry Capability by Primary Energy Source, 1990-2014 Maryland, U.S. Energy Information Administration, (June 2016) at Table 4,

http://www.eia.gov/electricity/state/maryland/xls/sept04md.xls.

⁸⁷ See supra Table 11. Coal facilities represented 39% of the in-State capacity in 2014, while nuclear facilities represented 14% of capacity. Therefore, coal and nuclear facilities combined for almost 53% of Maryland's generating capacity profile in 2014.

Conversely, oil and natural gas facilities, which operate as mid-merit or peaking units that come on-line when needed, generate less than 8% of the electric energy produced in Maryland while representing over 39% of in-State capacity.⁸⁸ Table 13 summarizes Maryland's 2014 in-State generation profile according to fuel source.

| Primary Fuel | Generation | | | |
|---------------------|--------------|------------------|--|--|
| Source | Annual (MWh) | Percent of Total | | |
| Coal | 17,603,291 | 46.5% | | |
| Oil & Gas | 2,969,346 | 7.8% | | |
| Nuclear | 14,343,334 | 37.9% | | |
| Hydroelectric | 1,615,523 | 4.3% | | |
| Other & Renewables | 1,302,159 | 3.4% | | |
| Total | 37,833,653 | 100.0% | | |

 Table 13: Maryland Generation Profile, 2014⁸⁹

Unlike the stability historically exhibited by Maryland's summer capacity profile, the percentage of in-State generation derived from various fuel sources continues to evolve as illustrated in Figure 16 below. Between 2007 and 2014, in-state coal generation decreased by approximately 12,086 GWh, causing the percentage of in-state generation derived from coal to decrease from 59.2% in 2007, to roughly 46.5% in 2014.

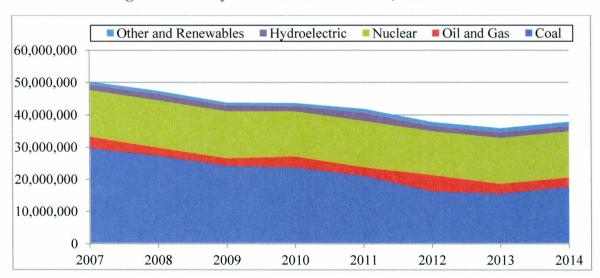

Figure 16: Maryland Generation Profile, 2007 – 2014⁹⁰

⁸⁸ Id.

⁸⁹ State Electricity Profiles 2014, U.S. Energy Information Administration, (June 6, 2016) at Table 5, http://www.eia.gov/electricity/state/Maryland/xls/sept05md.xls.

http://www.eia.gov/electricity/state/maryland/xls/sept05md.xls

⁹⁰ Electricity Power Industry Generation by Primary Energy Source, 1990-2014 Maryland, U.S. Energy Information Administration, (June 2016) at Table 5,

The standard life expectancy for coal generation facilities is approximately 40 years, though extensions can often be granted for up to 60 years. This assessment places a significant percentage of total Maryland coal generation capacity at or near the end of its normal operational life, a fact made especially concerning considering that coal generation facilities provided 46.5% of the in-State generation in 2014. If operational extensions for Maryland coal generation units are not requested, the need for additional in-State resources will be further necessitated to avoid potential reliability concerns.

PJM currently registers 6,361 MW of capacity resources requesting deactivation within the RTO.⁹¹ The only plant with a pending deactivation request located in Maryland is Wagner 2 (BGE zone, 135 MW). PJM states that the reliability analysis for Wagner 2 is complete and no impacts were identified.⁹²

Outside of the State, but within the four transmission zones that include Maryland, there are two plants requesting deactivation – McKee 1 and McKee 2 in the DPL zone, which account for a combined 34 MW of capacity.⁹³ PJM completed a reliability analysis and identified no reliability impacts associated with the May 31, 2017 scheduled deactivation of McKee 1 and McKee 2.94

2. Proposed Conventional Generation Additions⁹⁵

The construction of new generation, both conventional and renewable, is a way to address the in-State capacity and electricity import issues discussed in previous sections. As illustrated in Table 14 below, all of the new conventional generation proposed in Maryland during the 2016 – 2025 planning period is natural gas fired. There is no proposed new coal, oil, or nuclear generation in the State during the planning period. There are four projects from two different transmission owners planned, with projected in-service dates ranging between 2017 and 2018. The four facilities, represented in the below chart and totaling 3,355 MW, are currently under construction.

⁹¹ Future Deactivations, PJM (last visited November, 2016),

 $^{^{92}}$ *Id.*

 $^{^{93}}$ Id.

⁹⁴ *Id.*

⁹⁵ See Appendix Table 6 for a complete list of new conventional generation proposed in Maryland.

| Transmission Owner | Project Name | PJM Queue Status | Fuel Type | Project Capacity (MW) | Projected In-Service Date |
|-----------------------|--------------------------------------|-----------------------|-------------|-----------------------------|---------------------------------|
| ODEC | Wildcat Point Generation Facility | Under Construction | natural gas | 1,000 | 2017 Q2 |
| PEPCO | CPV St. Charles Energy Center | Under Construction | natural gas | 725 | 2016 Q4 |
| PEPCO | Mattawoman Energy LLC | Under Construction | natural gas | 1,038 | 2019 Q2 |
| PEPCO | Burches Hill – Chalk Point | Under Construction | natural gas | 736 | 2018 Q2 |

Table 14: Proposed New Conventional Generation in Maryland (MW)

3. Renewable Generation and Proposed Additions⁹⁷

The Commission recognizes the importance renewable generation plays in meeting Maryland's energy needs while also addressing environmental concerns. Renewable energy resources located in Maryland generated 416,826 MWh of electricity in 2015, as shown below in Table 15. The largest source of non-hydroelectric renewable energy was the Montgomery County Resource Recovery facility, which is a municipal solid waste ("MSW") facility and represents a discretely dispatchable energy resource. In 2015, the Montgomery County MSW facility generated 329,219 MWh.

| Primary Fuel Source | 2015 Generation (MWh) | Percent of Total Renewable Generation |
|------------------------|--------------------------|--|
| Biomass & Refuse | 329,219 | 80.0% |
| Methane / Landfill Gas | 27,213 | 6.5% |
| Solar | 60,162 | 14.4% |
| Wind | 224 | 0.1% |
| Other | 8 | 0.0% |
| Total | 416,826 | 100.0% |

Table 15: Maryland Generation (MWh) from Renewable Sources, 2015⁹⁸

Based on the PJM queue, Maryland's renewable generation capacity is planned to increase by an estimated 2,209 MW over the next few years as shown in Table 16 below. This does not, however, account for smaller renewable generators, notably residential

http://www.pjm.com/planning/generation-interconnection/generation-queue-active.aspx.

⁹⁶ Generation Queues: Active (Maryland), PJM (November, 2016)

⁹⁷ Maryland's Renewable Portfolio Standard has helped incent a significant amount of new renewable generation capacity in Maryland via Renewable Energy Credits ("RECs") and the Alternative Compliance Payments submitted to the Strategic Energy Investment Fund. RECs are the environmental attributes of renewable generation, and are separate from the actual electricity generation from Maryland's renewable resources. More details can be found at the *Renewable Energy Standard Report;* available at: http://www.psc.state.md.us/wp-content/uploads/2016-Renewable-Energy-Portfolio-Report.pdf.

⁹⁸ See Appendix Table 7 for unit-by-unit reporting as provided by the Maryland utilities.

solar; these smaller renewable generators are not required to obtain PJM interconnection status, but simply require interconnection with the local utility.

| Transmission Owner | Fuel Type | In-Service Date Range ⁹⁹ | Total Capacity (MW) |
|-----------------------|-----------|--|---------------------------|
| APS | Solar | 2016 - 2017 | 28.5 |
| | Hydro | 2014 | 0.4 |
| BGE | Methane | 2013 | 4 |
| | Solar | 2016 - 2018 | 22 |
| DDI | Solar | 2016 - 2018 | 224.5 |
| DPL | Wind | 2016 - 2018 | 250 |
| Total (MW): | | | 529.4 |

Table 16: Proposed New Renewable Generation in Maryland

Additionally, the amount of solar resources in Maryland will continue to increase due to a suite of State policy initiatives: the requirement that the RPS solar carve-out be interconnected to the distribution network serving Maryland; net metering incentives; tax incentives; the community solar pilot program; and grants administered by the Maryland Energy Administration. The increasing renewable generation penetration may have the potential to impact the grid, and the Commission will continue to monitor the successful integration of these renewables.

⁹⁹ In-service dates of 2013 and 2014 represent initial in-service projections and do not account for any delays experienced during construction.

V. <u>Conclusion</u>

Electricity sector planning will continue to be effected by several different issues over the next ten years, including projections regarding Maryland utility customers, energy sales, and in-State capacity and generation profiles. The Maryland utilities' load forecasts indicate a modest amount of projected annual growth in the number of customers, energy sales, and peak demand throughout the State during the 2016 - 2025 planning horizon. The PJM interconnection queue indicates an expected increase in both conventional and renewable generation in the State over the next several years. In response to these, and other developments, the 2017 - 2026 Ten-Year Plan will review and assess the impacts that the above-mentioned issues will have on Maryland's long-term electricity resource planning.

VI. Appendices to the Public Service Commission of Maryland's Ten-Year Plan (2016 – 2025) of Electric Companies in Maryland

*All data in the following appendices was derived from the Utilities' responses to Staff's Data Request

Appendix 1(a): Maryland Customer Forecasts

| Year | Berlin | BGE | Chop- tank | DPL | Easton | Hagers- town | PE | Pepco | SMECO | Thur- mont | William -sport | Total |

Appendix Table 1(a)(vi): Resale (number of customers)

Note: A&N and Somerset did not report applicable information for this table.

<u>Note:</u> The "Resale" class refers to "Sales for Resale," which is energy supplied to other electric utilities, cooperatives, municipalities, and federal and state electric agencies for resale to end-use consumers. PE is the only utility with any resale customers; these wholesale customers are PJM, Monongahela Power Company, West Penn Power Company and Old Dominion Electric Cooperative.

Note: A&N and Somerset did not report applicable information for this table.

¹⁰⁰ Berlin reported to Staff 6.8MW of DSM savings per year. This was attributed to the town generating 6.8MW of fossil fuel generation from generators that they own, operate, and dispatch - independent of PJM.

¹⁰¹ Choptank's DSM programs include: a voluntary program among the consumers to drop load during "beat-the-peak" alerts; a legacy A/C & water heater switch program; and the availability of experimental interruptible rates, in which a few consumers are still enrolled.
